

# ERUPTING THE MODEL

The kit contains enough eruption powder for 2 or 3 eruptions.  
Pour about a teaspoon into the vial.  
Add water and watch it erupt.

*You can continue erupting your model with inexpensive safe household supplies, as described below.*

Materials Needed: Baking Soda, Vinegar  
Optional: Food Coloring, Liquid Dish Soap

1. Keep your model on the working tray to catch the mess.  
Put a heaping teaspoon of baking soda into the plastic vial.
2. Add vinegar to fill the remaining space in the vial. It will immediately start to bubble over. You may wish to add several drops of food coloring to create more realistic lava. Several drops of liquid dish soap will make the eruption foam.
3. After cleaning the mess, it can be activated again by adding more baking soda and vinegar.
